

Nexora Corporate Knowledge Base: Product Triage Guide

Target Role: PRODUCT | Version: Official | Published: 2026-09-25

1. Feature Prioritization (RICE Scoring)

Feature proposals are prioritized using the RICE framework: $(\text{Reach} \times \text{Impact} \times \text{Confidence}) / \text{Effort}$. High-RICE initiatives are slotted into quarterly product roadmaps.

2. User Feedback Loops

Customer feature requests from Zendesk, Gong, and sales calls are aggregated in Productboard and reviewed bi-weekly with engineering leads.

6. Quarterly Roadmap Planning

High-RICE initiatives are committed into quarterly roadmaps with named owners and success metrics. Mid-quarter insertions require displacing lower-RICE work explicitly, never silently.

7. Success Metrics

Every roadmap item defines one primary metric tied to Reach or Impact before build starts, so prioritization claims remain falsifiable after launch.

8. Sunset Process

Feature removal follows the same rigor as launch: usage analysis, customer notice period, migration path, and a rollback plan, scored and triaged like any proposal.
